DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-14 rejected under 35 U.S.C. 103(a) as being unpatentable over Abdelgany et al. (6584090), and further in view of Shalom et al. (6166601) and further in view of Abdelmonem et al. (6622028).

As per claims 1,8, Abdelgany discloses a transceiver comprising a transmit path and receive path (Fig. 4). Both paths comprise RF filters (164,92,168,98,176,78,74,156 ect.). The system is a CDMA system with frequency band channels. The device further comprises antenna 22 coupled to both the transmit and receive paths. However, Abdelgany does not disclose circuitry to compensate for the non-linearity of both transmit and receive RF filters.

Shalom discloses a transceiver that applies digital equalization to the RF amplifier in order to produce highly linear amplification (Col 3 lines 29-65). It would have been obvious to one of ordinary skill in the art at the time of this application to implement digital equalization for both the transmit and receive amplifiers for the advantage of producing a highly linear response form the amplifiers.

Abdelmonem discloses a transceiver (Col 3 line 60 to Col 4 line 15) and teaches that an equalizer may be used to compensate for the non-linear behavior of the receive RF filters (Col 5 line 58 to Col 6 line 5) in wide channel systems such as W-CDMA. It would have been obvious to one of ordinary skill in the art at the time of this application to implement digital equalization in the transceiver for the advantage of compensating for nonlinear filter effects.

As per claims 2,3,9,10, the device of the claim 1 rejection would compensate for all transmit and receive channels.

As per claims 4,5,11,12, the device comprises an FIR which is a DSP (SHALOM: Col 3 lines 45-65).

As per claims 6,7,13,14, Abdelmonem discloses that the system may be a W-CDMA system, which has the same ranges of transmit and receive frequencies as specified in claim 6.

Application/Control Number: 10/024,107
